Tree Planting Guidelines
Tennessee Department of Agriculture, Forestry Division

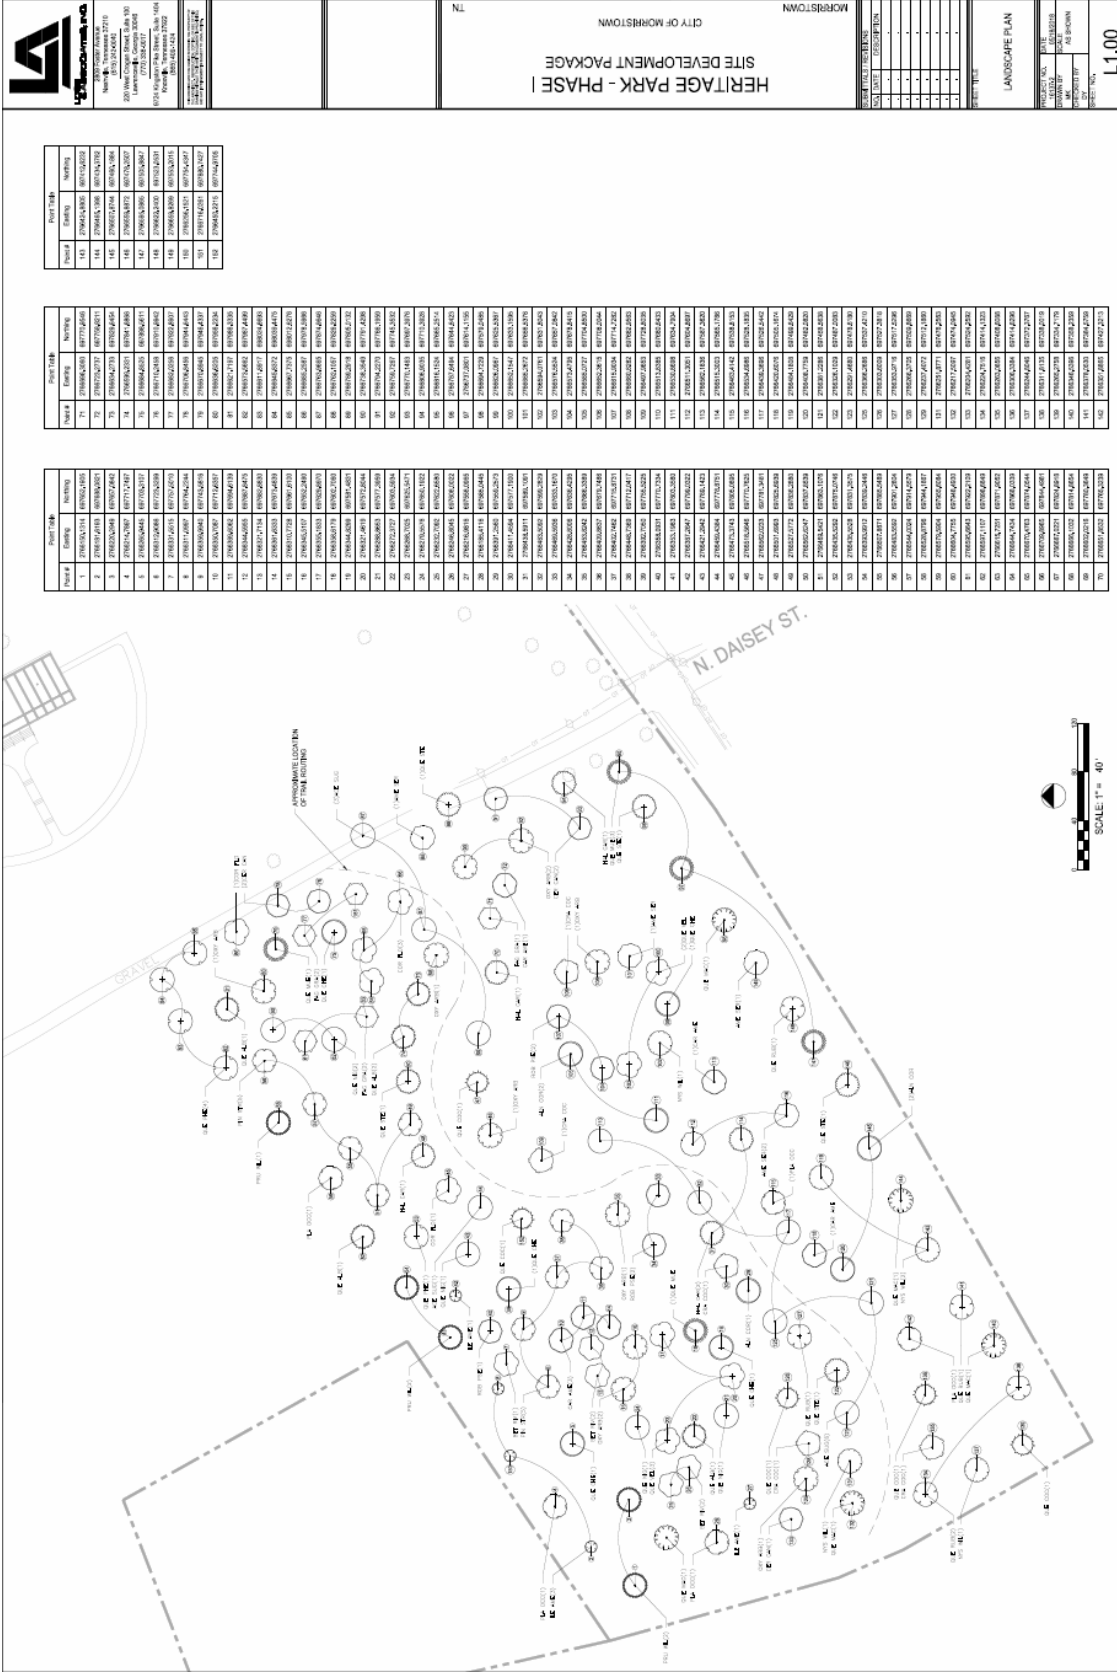

In order to have a healthy tree in the future; the tree must be planted properly. The following are guidelines to assist you in planting your tree properly. Prior to planting remember to move the tree by the root ball or the container. Never grab it by the trunk.

1. **Digging the Hole:** The planting hole should be at least twice the width of the root ball or container to encourage the roots to grow into the surrounding soil. The sides of the planting hole should be sloped. The depth of the hole should be the same as the distance from the root flare of the tree to the bottom of the container or ball. Most trees have the root ball below the top of the ball or soil in the container, so digging a hold the same depth of the ball or soil in the container often results in planting the tree too deep. One can check the root flare depth by digging down next to the trunk to find the flare.
2. **Tree Preparations:** For container trees, remove the container. Place the root ball in the hole. Cut the circling roots in the outer part of the ball with 4 to 6 cuts or gently pull the roots out of the ball and plant them in trenches leading away from planting hold. (A planting hole does not have to be round.) For B&B trees, place the ball in the hole, then remove the rope around the trunk, and then reach down in the hold and cut away as much burlap as possible. This should be done after the tree is in its final position and ready to be back filled.
3. **Backfill:** Use the same soil that was taken out of the hole. If the soil is very poor and appears to need topsoil, increase the hole size and sparingly mix in some local topsoil (avoid using potting soil, peat moss, and soil amendments). Remote the stones and other debris. Fill the hold halfway with backfill, then water. Finish filling the hole with the backfill and water again. Make sure to work the soil around the ball firmly to eliminate any air pockets. Also, make sure the tree is vertical and properly supported, but do not pack the soil around the trunk.
4. **Mulch:** The area around the tree should be mulched with woodchips, barkchips, or pine mulch. The mulch should be 3 to 4 inches thick and cover the entire planting area and beyond. The mulch needs to be placed in a donut or tire shape around the trunk of the tree. The mulch must be kept away from the trunk of the tree to keep insects away and prevent the trunk from being excessively wet. Mulch helps conserve soil moisture, reduces the competition from unwanted weeds, keeps lawn mowers and string trimmers from damaging the trunk, and moderates soil temperature extremes. *Do not use sawdust, black plastic, or grass clippings as mulch. Do not make mulch volcanoes.*
5. **Trunk Wraps:** Research indicates there are not benefits from using trunk wraps and it may encourage damaging insects or diseases.
6. **Staking:** Staking is not necessary if the tree has a proper size root ball and has not been pruned too high. Stakes may help prevent lawnmowers and string trimmers from damaging the tree. If staking is needed for supports, attach them so the tree has some sway. NEVER leave wires or straps on the tree for more than one growing season.

Tree Planting Guidelines Continued

7. **Fertilizing:** Generally new trees do not need fertilizers. Using the wrong product could damage the already reduced root system. Fertilize the first year only if a specific problem develops.
8. **Pruning:** Prune only the branches that are dead, broken or severely deformed during the first growing season. Buds produce hormones that stimulate root growth, so keep the removal of buds to a minimum.
9. **Timing for Planting:** The best time of year to plant your tree is November through March.
10. **Tree Size:** Trees 2 inch caliper or less are recommended unless a larger size is justified. Smaller trees recover from transplant shock and commence with normal growth more quickly.
